

# Course wrap-up; Glossary

## Cybersecurity Course 3

Wow, we have covered a lot in this course!

Let's review everything we've discussed.

You learned about networks, network architecture, and the best practices used by security professionals to secure a network against security breaches.

As we bring this course to a close, let's review what you've learned about security networks so far.

First, we explored the structure of a network.

A security analyst must understand how a network is designed to be able to identify parts of a network that present vulnerabilities and need to be secured.

Next, we learned about network operations and how they affect the communication of data.

Network protocols determine how the data is transmitted over the network.

As communication takes place over the network, malicious actors may use tactics such as denial of service attacks, packet sniffing, and IP spoofing.

Security analysts employ tools and measures such as firewall rules to protect against these attacks.

We also discussed security hardening.

Security hardening is used to reduce the attack area of a network.

This means the attack does not disable an entire network.

Security hardening can be done at the hardware level, the software level, or the network level.

Securing networks is an essential part of a security analyst's duties.

Knowledge of a network and its operations and security practices will ensure that you are successful in your career as a security analyst.

And that brings us to the topic of our next course, which will cover computing basics for security analysts.

In that course, you'll learn how to use the Linux command line to authenticate and authorize users on the network, and to use SQL, otherwise known as SQL, to communicate with databases.

Great work getting here!

All of the concepts you've learned in this section will be essential for success in your role as security analyst.

Now you can move on to the next course. Enjoy!

# Glossary: Terms and definitions from Course 3

## A

Active packet sniffing: A type of attack where data packets are manipulated in transit

Address Resolution Protocol (ARP): Used to determine the MAC address of the next router or device to traverse

## B

Bandwidth: The maximum data transmission capacity over a network, measured by bits per second

Baseline configuration: A documented set of specifications within a system that is used as a basis for future builds, releases, and updates

Bluetooth: Used for wireless communication with nearby physical devices

Botnet: A collection of computers infected by malware that are under the control of a single threat actor, known as the "bot herder"

## C

Cloud-based firewalls: Software firewalls that are hosted by the cloud service provider

Cloud computing: The practice of using remote servers, application, and network services that are hosted on the internet instead of on local physical devices

Cloud network: A collection of servers or computers that stores resources and data in remote data centers that can be accessed via the internet

Controlled zone: A subnet that protects the internal network from the uncontrolled zone

## D

Data packet: A basic unit of information that travels from one device to another within a network

Denial of service (DoS) attack: An attack that targets a network or server and floods it with network traffic

Distributed denial of service (DDoS) attack: A type of denial or service attack that uses multiple devices or servers located in different locations to flood the target network with unwanted traffic

Domain Name System (DNS): A networking protocol that translates internet domain names into IP addresses

## E

Encapsulation: A process performed by a VPN service that protects your data by wrapping sensitive data in other data packets

## F

File Transfer Protocol (FTP): Used to transfer files from one device to another over a network

Firewall: A network security device that monitors traffic to or from your network

Forward proxy server: A server that regulates and restricts a person's access to the internet

## H

Hardware: The physical components of a computer

Hub: A network device that broadcasts information to every device on the network

Hypertext Transfer Protocol (HTTP): An application layer protocol that provides a method of communication between clients and website servers

Hypertext Transfer Protocol Secure (HTTPS): A network protocol that provides a secure method of communication between clients and servers

## I

Identity and access management (IAM): A collection of processes and technologies that helps organizations manage digital identities in their environment

IEEE 802.11 (Wi-Fi): A set of standards that define communication for wireless LANs

Internet Control Message Protocol (ICMP): An internet protocol used by devices to

tell each other about data transmission errors across the network

Internet Control Message Protocol (ICMP) flood: A type of DoS attack performed by an attacker repeatedly sending ICMP request packets to a network server

Internet Protocol (IP): A set of standards used for routing and addressing data packets as they travel between devices on a network

Internet Protocol (IP) address: A unique string of characters that identifies the location of a device on the internet

IP spoofing: A network attack performed when an attacker changes the source IP of a data packet to impersonate an authorized system and gain access to a network

## L

Local area network (LAN): A network that spans small areas like an office building, a school, or a home

## M

Media Access Control (MAC) address: A unique alphanumeric identifier that is assigned to each physical device on a network

Modem: A device that connects your router to the internet and brings internet access to the LAN

Multi-factor authentication (MFA): A security measure that requires a user to verify their identity in two or more ways to access a system or network

## N

Network: A group of connected devices

Network log analysis: The process of examining network logs to identify events of interest

Network protocols: A set of rules used by two or more devices on a network to describe the order of delivery of data and the structure of data

Network segmentation: A security technique that divides the network into segments

## O

Operating system (OS): The interface between computer hardware and the user

Open systems interconnection (OSI) model: A standardized concept that describes the seven layers computers use to communicate and send data over the network

On-path attack: An attack where a malicious actor places themselves in the middle of an authorized connection and intercepts or alters the data in transit

## P

Packet sniffing: The practice of capturing and inspecting data packets across a network

Passive packet sniffing: A type of attack where a malicious actor connects to a network hub and looks at all traffic on the network

Patch update: A software and operating system update that addresses security vulnerabilities within a program or product

Penetration testing: A simulated attack that helps identify vulnerabilities in systems, networks, websites, applications, and processes

Ping of death: A type of DoS attack caused when a hacker pings a system by sending it an oversized ICMP packet that is bigger than 64KB

Port: A software-based location that organizes the sending and receiving of data between devices on a network

Port filtering: A firewall function that blocks or allows certain port numbers to limit unwanted communication

Proxy server: A server that fulfills the requests of its clients by forwarding them to other servers

## R

Replay attack: A network attack performed when a malicious actor intercepts a data packet in transit and delays it or repeats it at another time

Reverse proxy server: A server that regulates and restricts the Internet's access to an internal server

Router: A network device that connects multiple networks together

## S

Secure File Transfer Protocol (SFTP): A secure protocol used to transfer files from

one device to another over a network

Secure shell (SSH): A security protocol used to create a shell with a remote system

Security hardening: The process of strengthening a system to reduce its vulnerabilities and attack surface

Security information and event management (SIEM): An application that collects and analyzes log data to monitor critical activities for an organization

Security zone: A segment of a company's network that protects the internal network from the internet

Simple Network Management Protocol (SNMP): A network protocol used for monitoring and managing devices on a network

Smurf attack: A network attack performed when an attacker sniffs an authorized user's IP address and floods it with ICMP packets

Speed: The rate at which a device sends and receives data, measured by bits per second

Stateful: A class of firewall that keeps track of information passing through it and proactively filters out threats

Stateless: A class of firewall that operates based on predefined rules and that does not keep track of information from data packets

Subnetting: The subdivision of a network into logical groups called subnets

Switch: A device that makes connections between specific devices on a network by sending and receiving data between them

Synchronize (SYN) flood attack: A type of DoS attack that simulates a TCP/IP connection and floods a server with SYN packets

## T

TCP/IP model: A framework used to visualize how data is organized and transmitted across a network

Transmission Control Protocol (TCP): An internet communication protocol that allows two devices to form a connection and stream data

Transmission control protocol (TCP) 3-way handshake: A three-step process used to establish an authenticated connection between two devices on a network

## U

Uncontrolled zone: The portion of the network outside the organization

User Datagram Protocol (UDP): A connectionless protocol that does not establish a connection between devices before transmissions

## V

Virtual Private Network (VPN): A network security service that changes your public IP address and masks your virtual location so that you can keep your data private when you are using a public network like the internet

## W

Wide Area Network (WAN): A network that spans a large geographic area like a city, state, or country

Wi-Fi Protected Access (WPA): A wireless security protocol for devices to connect to the internet
