# Installing, Updating, and Removing Software on Linux

Now that you know how to install, update and remove software on Windows, let's do the same for Linux. Let's nav
you'll actually see many different ways to install Git, this is because the different Linux distributions use different pa
to use this command apt install Git, apt is the command we use in Ubuntu's package manager, and the install opti
our terminal.

We're getting an error that says permission denied. Like Windows, when we install something on a machine, we n
software. Right now, we can preface this command with another Linux command sudo, which stands for super use
getting a lot of output. It's just asking if we want to continue installing this application, and since we do, I'm going to
same thing as we just did and install a newer software version. To remove a package, we could also use a comma
want to remove a package. This asks us if we want to continue with these changes. Let's go ahead and type y and
remove software on Linux and Windows. Nice work
