

Module 1 Glossary

New terms and their definitions: Course 1 Week 1

Abstraction: To take a relatively complex system and simplify it for our use

Algorithm: A series of steps that solves specific problems

ASCII: The oldest character encoding standard used is ASCII. It represents the English alphabet, digits, and punctuation marks

Binary system: The communication that a computer uses is referred to as binary system, also known as base-2 numeral system

Byte: A group of 8 bits

Character encoding: Is used to assign our binary values to characters so that we as humans can read them

Computer: A device that stores and processes data by performing calculations

Cryptography: The overarching discipline that covers the practice of coding and hiding messages from third parties

Decimal form- base 10 system: In the decimal system, there are 10 possible numbers you can use ranging from zero to nine

Digital divide: The growing skills gap between people with and without digital literacy skills

Information technology: The use of digital technology, like computers and the internet, to store and process data into useful information

Linux OS: Linux is one of the largest an open source operating system used heavily in business infrastructure and in the consumer space

Logic gates: Allow transistors to do more complex tasks, like decide where to send electrical signals depending on logical conditions

Open source: This means the developers will let other developers share, modify, and distribute their software for free

PDA (Personal Digital Assistant): Allows computing to go mobile

Punch cards: A sequence of cards with holes in them to automatically perform calculations instead of manually entering them by hand

RGB model: RGB or red, green, and blue model is the basic model of representing colors

UTF-8: The most prevalent encoding standard used today
