correct python syntax for print statmets with variables : print(f"{file_name} and other words in the print to console statment")

print(f"{file_name}")
 is this correct?

This code line alone will not print anything unless you have defined the variable `file_name` and assigned a value to it.

Assuming `file_name` is defined and has a value, the code line `print(f"{file_name}")` is correct syntax for printing the value of the variable `file_name` using an f-string in Python 3.6 and later versions.

The f-string is a string literal that is prefixed with the letter "f" or "F" and allows you to embed expressions inside curly braces `{}`. When the string is evaluated, the expressions inside the curly braces are replaced with their values.
