

Example 5: Graph $y = x^2 + 2x + 3$

Find the vertex and the axis of symmetry. Sketch these in.

- Find the x-intercept by plugging in 0 for y.
- Find the y-intercept by plugging in 0 for x.
- Reflect your points across the axis of symmetry and connect your dots with a smooth U-shaped (not V-shaped) curve.

fix the following

- $a = 1, b = 2, c = 3$
 - $x^2 + 2x + 3$
1. find the line of symmetry -
 1. $x = (b/2a)$
 2. $x = -(2) / 2(1) = -1$
 2. use this to find the vertex
 3. since we know that the along the x axis at -1 will be the vertex we replace x with 1 in the original formula
 1. $x = -1$
 2. $y = x^2 - 2x - 8$
 3. $y = 1^2 + -2 * 1 - 8 = 1 - 2 - 8 = -9$
 4. $y = -9$
 4. the vertex is (-1, -9)
 5. since the vertex is -1,-9 we know that x=-1 is the axis of symmetry
 6. finding the y-intercept is the easiest to start with because we just replace x with 0
 7. $x = 0 | y = x^2 - 2x - 8$
 8. $y = 0 - 8 = -8$
 9. y-intercept = (0,-8)
 10. so so To find the x-intercepts, you can set y equal to zero and solve for x:
 11. $y = 0 | x = (-b \pm \sqrt{b^2 - 4ac}) / 2a$
 1. $x = -(-2) \pm \sqrt{(-2)^2 - 4(1)(-8)} / 2(1)$
 $x = (2 \pm \sqrt{4 + 32}) / 2$
 $x = (2 \pm \sqrt{36}) / 2$
 $x = (2 \pm 6) / 2$
 $x = 8 / 2$ or $x = -4 / 2$
 $x = 4$ or $x = -2$

sooooo (-2,0) & (4,0)

12. so since we know 3 y axis points on the graph and the axis of symmetry we can get another point without doing much work

1. symmetry line = $x = 1$,

2. calc'd x-intercept 0,-8

1. the symmetry line is 1 and the known point is 0 since $1-0 = 1$ we can add that to the x coordinate of y and keep the same y coordinate to get the mirrored point making another point on the graph (2,-8)

3. since we need one more point for the graph we can choose say $x=3$, | $x^2 - 2x - 8$

1. $y = 3^2 - 3*2 - 8 = -5$

1. soooo the new point is (3,-5) if we mirror that along 1,-9 we get (-1, -5) because 3 is 2 more than 1, and 2 less than 1 is -1. we also keep the same y coordinate

4. so all points are:

1. (1, -9)

2. (0,-8)

3. (2, -8)

4. (3,-5)

5. (-1,-5)
